polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-CO
library is a subtracted library derived from the UI-R-AI
library consisted of unraped normalized libraries
constructed from tat placenta, adult lung, brain, liver,
kidney, heart, spleen, ovary, and muscle. The UI-R-EI
library consisted of a mixture of individually tagged
normalized libraries constructed from 8, 12 and 18-day
normalized libraries constructed from 8, 12 and 18-day
normalized libraries constructed from 9, 12 and 18-day
normalized libraries constructed from 9, 12 and 18-day
normalized libraries constructed from 9, 12 and 18-day
normalized libraries constructed from 61-sent
allows identification of the library of origin of a clone
within the mixture. The subtracted library (UI-R-CO) was
constructed as follows: PCR amplified cDNA inserts from
pool of UI-R-AI and UI-R-EI clones from which 3' ESTS had
been derived was used as a driver in a hybridization with
the pooled UI-R-AI and UI-R-EI library in the form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AA996811

Normalization and subtraction: two approaches to facilitate gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                   use pourted of a contract of the standard single-stranded single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to hydroxyapatite column chromatography, converted to bacteria (life Technologies) to generate the UI-R-CO library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,

polylinker; Site 1: Not 1; Site_2: Eco RI; The UI-R-AI
library is a subtracted library derived from the UI-R-AI
wixture of individually tagged normalized libraries
mixture of individually tagged normalized libraries
constructed from rat placenta, adult lung, brain, liver,
kidney, heart, spleen, voary, and muscle. The UI-R-EI
kidney, heart, spleen, voary, and muscle. The UI-R-EI
library consisted of a mixture of individually tagged
normalized libraries constructed from $1.2 and 18-day
normalized libraries constructed from $1.2 and 18-day
endryor. The tag is a string of 3-5 nucleotides present
between the Not I site and the oligo-dr track which
allows identification of the library of origin of a clone
within the mixture. The subtracted library (UI-R-CO) was
within the mixture. The subtracted library (UI-R-CO) was
constructed as follows: PCR amplified CDNA inserts from a
pool of UI-R-AI and UI-R-EI library in the form of
the pooled UI-R-AI and UI-R-EI library in the form of
circles (subtracted library) was purified by

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinaes. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMPAQ (gif 4732114/gbl AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
